Two wallets printed two billion dollars

What is real on Robinhood Chain this week

Seven days to 18 October 2026, 21:30 UTC. Every number below is counted from the chain's Uniswap pools, block by block, and can be re-run by anyone with a node. Pool and transaction ids are given in full so that you can.

The headline

Pools on Robinhood Chain reported **$4.9 billion** of trading against USDG, the chain's dollar, this week. **$3.0 billion** of that was trading. **$1.9 billion** was printed, and two wallets printed almost all of it.

What the pools reported	Pools	Reported volume	Of which self-cancelling	Share
Genuine USDG pools with a fee	7,812	$3,022M	$13M	0.4%
Genuine USDG pools with a zero fee	144	$318M	$292M	92%
Pools quoting a fake "USDG" against the real one	19	$1,600M	$1,600M	100%
All USDG-quoted pools	**7,975**	**$4,940M**	**$1,905M**	**38%**

How the trick works

Uniswap v4 settles a transaction's swaps net, at the end. Swap $5 million of USDG into a pool and $5 million back out in the same transaction and you owe the pool nothing, the pool owes you nothing, and two Swap events of $5 million each are written to the chain all the same. In a pool with a 0.3% fee that costs $30,000 a round trip, so nobody does it. In a pool with a zero fee it costs the gas.

So you create a token, pair it with real USDG in a zero-fee pool, provide the liquidity yourself, and swap against your own pool in a loop. One transaction this week, `0xa6e8cc05ea7a0538aa4907014b93853727f6ae0de764dedd3ea6b6a75adde5d3`, contains 80 alternating swaps of exactly $5 million: $400 million of reported volume, nothing moved. Three pools were taken to exactly $500 million, $500 million and $600 million.

We flag every transaction that swaps both ways in one pool with both token amounts netting to under 1% of the gross, and we call the result self-cancelling volume: trades that transfer nothing between any two parties. What the author meant by it is their business.

Where it ran

The ten largest cases, all zero-fee v4 pools, all one sender each.

Pool (v4 id)	Quoted token	Self-cancelling	Swaps	Sender	Dates
0xb77683d503a1be7dcd72b5533b9bbea04fc03dac494138db8e32ef8260a760cc	"USDG Robinhood" (a copy)	$600.0M	120	0xa307B4C7…	17–18 Oct

Two senders, then: `0xa307B4C7`… and `0x3F5D6D4a`…. In the ten largest cases we checked the pools' liquidity events as well: the wallet doing the round trips is the wallet that supplied the pool's liquidity in every one, and in seven of the ten it is the only liquidity provider. Other wallets did trade in those pools, mostly bots sniffing new pairs, to the tune of $315 thousand against $992 million of round trips over the week we first measured.

Outside zero-fee pools the pattern is essentially absent: $13 million in $3 billion. In the five earlier weeks we have checked so far, late June to early August, the share was zero. This is a recent operation, and it may stop as soon as it is noticed. The flag stays on regardless.

Why it matters to you

If your agent ranks pools by volume, it has been ranking a self-dealing pool above every real market on the chain. If you were reading HOOKR's, STANDARD's or BONER's dollar volume this week, 98%, 99% and 93% of what you saw in their USDG pools was one wallet talking to itself. If you are deciding where to provide liquidity, the busiest pool on your screen may have no counterparties at all.

Fake dollars, too

The first thing we had to remove was not the round trips. It was the dollars. Twenty-four tokens on this chain call themselves USDC, USDG or USDT. One is the Global Dollar. Ten of the twelve "USDC"s are a token named UpSide Down Cat with eighteen decimals; priced naively, one of its pools showed $400 billion in a week. Ninety tokens call themselves SPCX.

We now keep one token per symbol, the one in the most pools, and mark the rest as copies. For stocks we go further: Robinhood publishes a registry of its Stock Token contracts, and only those count as the real thing. There are 195 of them on the chain.

The chain this week, real volume only

Measure	Value
Real USDG-quoted volume	$3.0B across 7,956 pools
Wallets trading in those pools	124,700
Swaps decoded since 10 October	18.55 million
Swaps flagged self-cancelling	70,350
Automated wallets	11,457 of 239,185 we could judge, placing 43% of all swaps
One-sided herds (15+ automated wallets one way in one pool-minute)	about 1,500 a day
Largest herd of the week	171 automated wallets buying ETH in the ETH/USDG v4 pool 0x387bf619…, 18 Oct 19:47 UTC
Busiest minute of the week	2,848 wallets in one memecoin pool in sixty seconds, 165 of them software, 15 Oct 12:49 UTC
Official Robinhood Stock Tokens trading	187 of 195, in 961 USDG pools, $394M for the week. NVDA $90M, SPY $54M, SPCX $52M

What we do about it

Every swap in our data carries a self-cancelling flag. Every number Tethera publishes, every herd, every wallet label, every pool figure, is computed without them. The pool endpoint of the API returns both numbers, organic and printed, so you can check our work pool by pool: `api.tetheralabs.com/v1/pool/{pool}`.

What we are building

A pre-trade crowding check for automated traders: ask before you trade, and we tell you how many other bots are doing the same thing in the same pool right now. Free, no key: `api.tetheralabs.com/v1/crowding`. Next, a Uniswap v4 hook that charges the herd and pays whoever leans against it, with the automated-wallet set published on-chain so anyone can audit it.

Tethera Labs. Questions and corrections: TetheraLabs@proton.me.

Measured on Robinhood Chain mainnet. Every number is checkable against the chain; the pool and transaction ids are in the text.
